Forecasts summary

Future profitability

Cash forecast

/// Full profit and loss and cash flow forecast at page 14.

Past funding rounds

Here is an overview of the past funding rounds and valuations of the company.

No funding rounds to date

Current ownership

Here is an overview of the current shareholders in the company. More information on type of shares, unassigned shares, and in general a detailed cap table can be requested to the company in question.

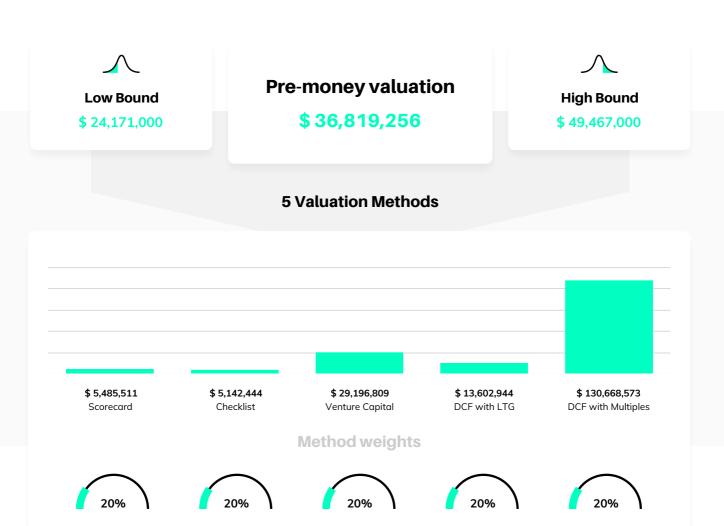

Valuation

The pre-money valuation displayed below is the result of the weighted average of different methods. The use of several methods is a best practice in company valuation, as looking at the business from different perspectives results in a more comprehensive and reliable view.

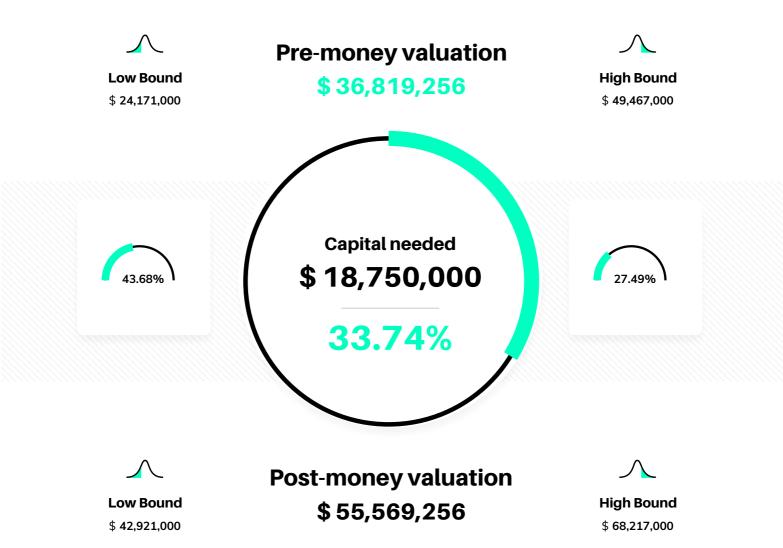

These methods are compliant with IPEV (International Private Equity Valuation) Guidelines and each of them will be explained in more detail in the following pages of the report.

More information on the weights can be found in the Appendix.

Current funding round

Please find below the amount of capital currently needed and the consequent percentage of equity based on the valuation of previous page as a starting point for the negotiations.

Starting from the post-money valuation of the company, the equity percentage that relates to the investment is calculated as investment/post-money valuation. Keeping the investment amount fixed, the lower the pre-money valuation, the higher the equity stake, and vice versa.

Use of funds

Here is a breakdown on how the company will use the capital raised.

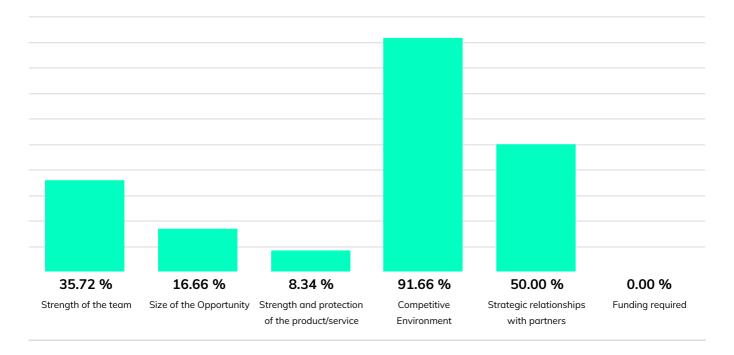

Qualitative methods

Scorecard Method: \$5,485,511

This method was conceived by William H. Payne of Ohio TechAngels group and endorsed by the Ewing Marion Kauffman Foundation. The valuation of the startup depends on how different this is from the assumed average of a set of comparable companies from the same region.

Startups' qualitative traits are divided in 6 criteria, compared with the assumed traits of the average company, and given a score according to whether it over- or under-performs the assumed average company. These scores are multiplied by weights that represent the impact of the criteria on the valuation. The sum of these weighted scores multiplied by the average valuation leads to the company's pre-money valuation.

Normalized scores of the company for each criteria

Parameters

Average valuation (United States): \$ 3,918,222

Weights of the criteria

Strength of the team: **30%**

Size of the Opportunity: 25%

Strength and protection of the product/service: 15%

Competitive Environment: 10%

Strategic relationships with partners: 10%

Funding required: 10%

/// Please see appendix for data sources, defaults, and breakdown of the traits

Checklist Method: **\$** 5,142,444

The creator of the method is Dave Berkus, one of the most prominent Californian angel investors. The valuation of the startup consists of intangible building blocks that sum up to the assumed maximum pre-money valuation.

The maximum pre-money valuation is split in 5 criteria according to their weight. The startup obtains portions of these maximum criteria valuations according to how close its qualitative traits are to the most desirable ones. Their sum is the startup pre-money valuation.

¦਼ੀ Parameters

Maximum valuation (United States): \$ 8,000,000

Criteria maximum valuations

Quality of the core team: \$ 2,400,000 (30%) Strategic Relationships: \$ 1,200,000 (15%)

Quality of the Idea: \$ 1,600,000 (20%) Operating Stage: \$ 1,600,000 (20%)

Product roll-out and IP protection: \$ 1,200,000 (15%)

/// Please see appendix for data sources, defaults, and breakdown of the traits

Qualitative traits summary

Below a summary of the traits at the basis of the scores for the two qualitative methods. Please see appendix for detailed breakdown of which trait is used in which method.

Team

Founders

Time commitment: Full time Average age: More than 45

Founded other companies before: Yes, with successful exit(s)

Core team skills and expertise

Working together for: **1 to 2 years** Years of experience in the industry: **50**

Business and managerial background: Top-tier management

experience

Technical skills: Most technical skills inhouse

Network

Board of advisors: Advisors not organized in a board

Legal consultants: Yes

Current shareholders: Friends and Family, Crowdfunding, Business

angel

Market

Total Addressable Market (TAM): \$ 1,400,000,000

Annual growth rate of the market: 3.00 %

Demand validated: Demand validated by competitors

Internationalization: Local focus now, opportunity for international

expansion

Product

Product roll-out: Minimum Viable Product

Feedback received: Fairly positive

Loyalty to the product/service: Still to be tested or under testing

Partners: Informal agreements with key strategic partners

Competition

Level of competition: Negligible competition

Competitive products are: On the same level

Differentiation from current solutions: Not comparable solutions

International competition: Not yet developed

Protection

Barriers to entry of the market: High

Applicable IP: Patent

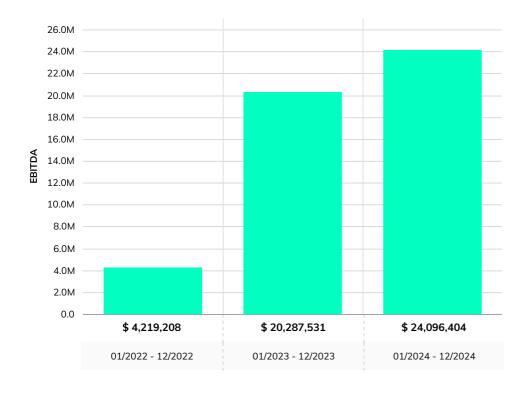

Current IP protection: IP protection secured at regional level

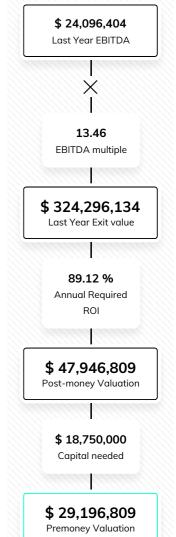

VC Method

Premoney Valuation: \$29,196,809

The VC (Venture Capital) method is one of most common approaches among financial practitioners in the private company market. The startup is given the valuation that will grant investors a predetermined return at the exit.

The potential exit value of the company is computed with an industry-based EBITDA multiple. The valuation is equal to this value discounted by a required ROI (Return On Investment). This depends on the startup's stage of development, higher for early stage riskier companies, lower for more mature ones. It is the minimum rate that will allow investors to have positive returns from portfolios where most companies fail and gains come from a selected few.

h

Industry Multiple: 13.46

Annual Required ROI: 89.12 %

/// Please see appendix for data sources and defaults

DCF Methods

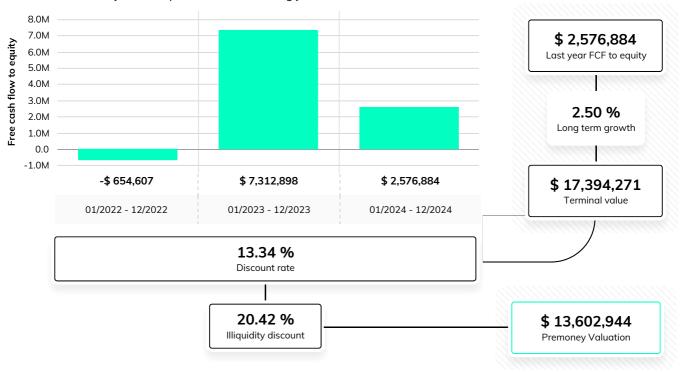

The DCF (Discounted Cash Flow) methods represent the most renown approach to company valuation, recommended by academics and a daily tool for financial analysts. The valuation is the present value of all the free cash flows to equity the startup is going to generate in the future, discounted by its risk.

These methods weight the projected free cash flow to equity by the probability the startup will survive. Then, the flows are discounted to present by a rate that represents risks related to industry, size, development stage and profitability. Lastly, an illiquidity discount is applied to the sum of the discounted cash flows to compute the valuation.

The value of cash flows beyond the projected ones is represented by the TV (Terminal Value) and the way it is calculated is the difference between the following two methods.

DCF with LTG: \$ 13,602,944

The DCF with LTG (Long Term Growth) assumes the cash flows beyond the projected ones will grow forever at a constant rate based on the industry and computes the TV accordingly.

Parameters

Long term growth: 2.50 %

Illiquidity discount: 20.42 %

Beta: 2.22

Market Risk Premium: 5.20 %

Survival rates

Year 1: 86.43 %

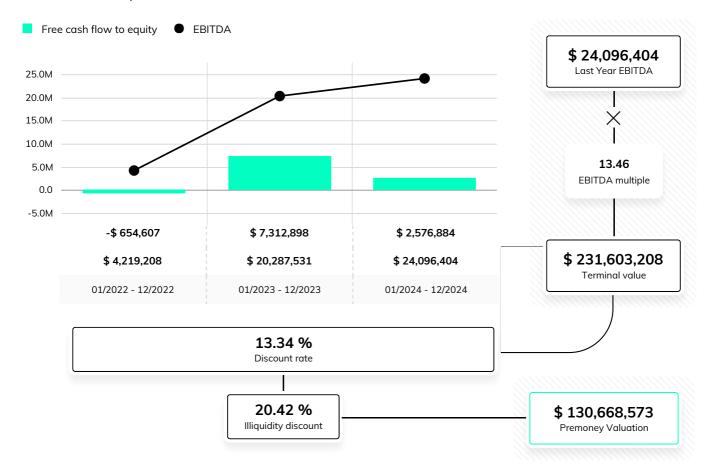

Beta: 2.22

Year 2: 77.01 %

/// Please see appendix for data sources and defaults

DCF with Multiples: \$ 130,668,573

The DCF with Multiple assumes the TV (Terminal Value) is equal to the exit value of the company computed with an industry-based EBITDA multiple.

Parameters

EBITDA multiple: **13.46**Illiquidity discount: **20.42** %

Discount rate

Risk free rate: 1.82 %

Beta: **2.22**

Market Risk Premium: 5.20 %

Survival rates

Year 1: **86.43 %**

Year 2: **77.01 %**

Year 3: **71.42 %**

/// Please see appendix for data sources and defaults

Financial Projections

Profit & Loss

The profit & loss projections are displayed below. Data about revenues and operating costs are provided by the company. Depreciation and amortization, interest, and taxes are either provided by the company or estimated by Equidam. Please consult our methodology document for more details.

Appendix

Weights of the methods

The default weight of each method is determined by Equidam based on the stage of development, and they are shown below. They can be manually adjusted by the company.

Default weights of the 5 methods

Stage of development	Checklist Method	Scorecard Method	VC Method	DCF with LTG	DCF with Multiples
ldea stage	38%	38%	16%	4%	4%
Development stage	30%	30%	16%	12%	12%
Startup stage	15%	15%	16%	27%	27%
Expansion stage	6%	6%	16%	36%	36%

Sky Quarry Inc. stage of development: Startup stage

These are determined according to the following principles:

- Qualitative information is more important in early stage companies, where performance uncertainty is extremely high, so qualitative methods are weighted in more
- The investors' view is equally important across all stages, so the weight of the VC method does not change
- Quantitative information is more reliable in later stages, when a company already has a proven financial track record.

Therefore, it is possible to use the DCF methods more extensively as projected results get founded in past performance

Qualitative methods

Default average and maximum valuations data sources

Dataset: Pre-money market valuations from transactions in the last 30 months of company in all industries, all countries,

and at seed funding stage

Datasource: Crunchbase

Usage: Computation of average and maximum (net of outliers) pre-money valuations in given geographic areas for the

qualitative methods (Scorecard and Checklist respectively)

Update: Biannual

Average valuation (Scorecard Method) in United States: \$ 3,918,222

Maximum valuation (Checklist Method) in United States: \$8,000,000

VC method

Below the sources of the valuation parameters used in the VC Method: EBITDA Multiple and Annual Required ROI, and their default values provided by Equidam

EBITDA multiple

Description: Enterprise value on EBITDA multiples computed over a dataset of global, publicly listed firms organized by

industry

Datasource: Prof. A. Damodaran, NYU Stern School of Busines

Update: Annual

Notes: We favor the use of EBITDA multiple, as we believe revenue multiples fail to capture the ability of startups to

generate cash flow, i.e. the ultimate determinant of value.

Sky Quarry Inc. industry: Waste Management, Disposal & Recycling Services

Waste Management, Disposal & Recycling Services EBITDA multiple: 13.46

Annual Required ROI

The default annual required ROI rates are determined by Equidam based on the returns investors require for companies at different stage of development, and are shown below. They can be manually adjusted by the company.

Sky Quarry Inc. stage of development: Startup stage

DCF Methods

Below the sources of the valuation parameters used in the DCF Methods: Discount Rate, Survival Rates and Illiquidity Discounts, and their default values provided by Equidam.

Discount rate

Risk Free Rate

Description: 10Y government rates

Datasource: Trading Economics (tradingeconomics.com), various public databases

Update: Bi-annual (but more frequent if macroeconomic conditions are more volatile)

Notes: For the Eurozone we apply the German 10Y Bond rate

Sky Quarry Inc. country: United States

United States risk free rate: 1.82%

Industry betas

Description: Industry beta computed over industry specific portfolios of global, public listed companies (same as in EBITDA

multiple)

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Annual

Sky Quarry Inc. industry: Waste Management, Disposal & Recycling Services

Waste Management, Disposal & Recycling Services default beta: 2.22

Market Risk Premium

Description: Country based total equity risk premium as implied in the previous 12 trailing months.

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Biannual

Sky Quarry Inc. country: United States

United States default market risk premium: 5.20%

Survival Rate

Dataset: Country-level survival probabilities of the latest cohort of companies with three years of data available.

Datasource: European Office of Statistics (http://ec.europa.eu/eurostat), U.S. Bureau of Labor Statistics (https://www.bls.gov/),

specific academic research and public offices of statistics for different countries.

Update: Annual

Sky Quarry Inc. year of incorporation: 2019

Default survival rate Year 1:86.43%

Default survival rate Year 2: 77.01%

Default survival rate Year 3: 71.42%

Default survival rate Year 4: 66.78%

Default survival rate Year 5: 62.99%

Default survival rate Year 6: 59.79%

Default survival rate Year 7: 57.01%

Default survival rate Year 8: 54.57%

Default survival rate Year 9: 52.38%

Illiquidity discount

The default illiquidity discount is assigned based on current profitability and projected revenues, according to the approach suggested by William L. Silber.

Sky Quarry Inc. illiquidity discount: 20.42%

DCF with LTG

Long term growth

Dataset: Global, publicly listed companies organized by industry (same as in EBITDA multiple)

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Annual

Notes: The value is winsorized over a 0% - 2.5% range. We do not want the long term growth to be above world GDP

growth expectations, as it would mean the company is going to overgrow world economy at some point in time

Sky Quarry Inc. industry: Waste Management, Disposal & Recycling Services

Waste Management, Disposal & Recycling Services default long term growth: 2.50

DCF with Multiples

EBITDA multiple

Dataset: Global, publicly listed companies organized by industry

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Annual

Notes: We favor the use of EBITDA multiple, as we believe revenue multiples fail to capture the ability of startups to

generate cash flow, the ultimate determinant of value.

Sky Quarry Inc. industry: Waste Management, Disposal & Recycling Services

Waste Management, Disposal & Recycling Services default EBITDA multiple: 13.46

Last Available Balance Sheet

Below the simplified, last available balance sheet of the company.
